

Gunin Sharma

Bangalore, India

2024gunin.sharma@vidyashilp.edu.in — +91 9686779899 — [GitHub](#) — [LinkedIn](#)

Data Science student focused on applied machine learning, AI systems, and scalable data-driven applications, and an interest in emerging technologies including blockchain and Web3. Open to internships in data science, machine learning, or data engineering.

Education

Vidyashilp University — B.Tech (Hons), Major: Data Science, Minor: Finance 2024 – 2028 (Expected)
Merit Scholarship Recipient (40%) for Academic Excellence
CGPA: 9.21 / 10

Experience

AI Engineer Intern — Opyo Studio May 2025 – Present
ML Intern — Margroms May 2025 – Present

Projects

GridEdge — F1 Fantasy Team Optimizer [GitHub](#)

Python, LightGBM, PuLP, FastF1 API, Flask, Docker

- Built an end-to-end ML pipeline that ingests real F1 race data via the FastF1 API, engineers 5 rolling features per driver (recent form, position consistency, qualifying grid, DNF rate, team momentum), and trains a LightGBM regressor on a rolling 30-race window to predict fantasy points — avoiding distribution shift from stale seasons.
- Formulated a binary Integer Linear Programming model (PuLP/CBC solver) to select the optimal 5-driver squad under a \$100M budget constraint, with automatic fallback to `scipy.optimize.milp`.
- Implemented walk-forward backtesting across the last 8 races of a season, comparing model performance against a naive most-expensive-drivers baseline to validate real-world predictive value.
- Built MLOps infrastructure including weekly automated retraining with incremental data fetching, structured logging, and Docker Compose deployment with persistent model and data volumes.

AI Market Event Detector

[GitHub](#)

Python, Streamlit, Scikit-learn, Plotly, Financial APIs, LLMs

- Built a financial anomaly detection system using **Isolation Forest** to identify unusual price, volatility, and volume movements across stock tickers.
- Reduced irrelevant news noise by **~60%** through keyword filtering and company-aware filtering, surfacing only news that directly relates to detected market anomalies.
- Integrated **Gemini AI** to generate analyst-style explanations for detected market anomalies.
- Processed **100+ trading days** of stock data per run, ensuring detections are based on statistically meaningful historical patterns.
- Developed a **Streamlit** dashboard with anomaly visualization and downloadable analytical reports.

AI-Driven Rural Job Allocation System (1st Place, Sahayog 2026 Hackathon)

Python, FastAPI, Twilio, Gemini AI, VEDAS API, Scikit-learn

- Built a voice-enabled job-matching system for rural workers using Twilio for call handling and Gemini AI for multilingual conversation.
- Integrated ISRO VEDAS API to pull real-time NDVI/MNDWI geospatial indices and used them in a weighted scoring engine to match workers to infrastructure jobs by location and skill.
- Delivered a working end-to-end FastAPI pipeline with speech input, geospatial scoring, and SMS output within a single overnight sprint.

Technical Skills

Languages: Python, SQL

Machine Learning & Data Science: Scikit-learn, LightGBM, Pandas, NumPy, NLTK

Visualization: Matplotlib, Seaborn, Plotly, Streamlit

Backend Tools: FastAPI, Flask, Docker, Git, REST APIs, PuLP, Web3.py, OpenCV, MediaPipe

Achievements

Winner — Sahayog 2026 Overnight Hackathon — Vidyashilp University

Certifications

IBM Data Science Fundamentals with Python and SQL Specialization — IBM / Coursera
